

A controlled examination journey

Client demonstration | Working proof of concept | Synthetic examination data

Plan. Prepare. Deliver. Review.

One platform brings examination setup, approved papers, candidate delivery and staff oversight into a connected workflow.

For administrators

Create examinations, manage centres and workstations, and keep candidates and questions in the correct exam.

For examination staff

Separate question authoring from review, inspect paper integrity, and resolve delivery incidents.

For candidates

Follow a guided sign-in and examination flow, save answers, and receive a submission receipt.

OPENING LINE

"This demonstration shows how an examination moves from configuration to controlled delivery and evidence."

Start with the examination

Examinations > Open an exam > Overview

Show

The exam name, code and status stay visible above the workspace tabs.

Explain

Create the schedule and blueprint, then register candidates and prepare questions within that examination.

Client value

The team works in a clearly identified exam context, with direct links to the next preparation step.

Keep candidates inside their examination

Examinations > Selected exam > Candidates

CLIENT-DEMO-2026

Client demonstration examination

Draft

Overview

Candidates

Question bank

Paper builder

Integrity & approvals

Candidates

Manage registration and accommodations for candidates in this examination.

1 registered

Candidate register

Search name or application I

All eligibility

All candidates

CANDIDATE	CANDIDATE ID	ELIGIBILITY	ENROLMENT		ACCOMMODATIONS	
DC Demo Candidate CLIENT-DEMO-001	CND-00501	Eligible	No face	No fingerprint	None	Open

Show

Add candidate, Import CSV, search and eligibility filters.

Explain

Registration and accommodations belong to the selected exam. Imports are validated before committing records.

Client value

Staff can check the correct register without switching between unrelated global lists.

Demonstration note

The displayed candidate is synthetic. "No face" means no enrolled reference is recorded.

Approve the content before delivery

Examination workspace > Question bank > Paper builder > Integrity & approvals

1. Author

Create choice-based or written questions. Category rules supply the marking values.

2. Review

A different authorised reviewer evaluates the question before it becomes eligible for assembly.

3. Assemble

The builder selects eligible questions from this exam bank against category and difficulty quotas.

4. Publish

Inspect the manifest and request publication. Profiles can require two authorised approvals.

What to demonstrate

Open a question, show its review status, then open Paper builder. Explain that a shortage of approved questions blocks assembly instead of silently changing the blueprint.

INTEGRITY

Content hashes, signatures and encryption are implemented with development keys. Production key management is a separate integration.

Guide the candidate from sign-in to submission

Candidate workstation view | Use a prepared, published demo examination

Before the paper

Application ID and password sign-in.

Workstation and network checks follow the selected policy.

Consent and configured identity checks guide the candidate into the exam.

During the paper

Choice answers save through the answer service.

Written answers use the explicit Save written answer action.

Save status, navigation and flagged questions support progress.

At submission

The candidate reviews and submits final answers.

Submission locks the attempt and provides a receipt.

Receipt download and application print actions require a fresh facial check.

Presenter cue

Show an answer being saved, a question being flagged, and the submission review. Use a seeded published exam for delivery; a newly created draft cannot start a candidate attempt.

BOUNDARY

The browser is not an operating-system kiosk. Face/fingerprint comparison is simulated in the default demonstration.

Give staff visibility and responsibility

Infrastructure, live examination, alert queue and audit log

Centres and workstations

Register a centre with capacity and approved network details. Add its workstation and show that registration leaves the machine pending approval.

Live examination and alerts

View candidate progress and review raised incidents. Demonstrate human review and recovery decisions with the presenter's simulated scenarios.

Roles and approvals

Use role-specific access for administration, authors, reviewers, security staff and invigilators. Question authors do not independently approve their own work.

Audit and evidence

Review the recorded actions and integrity information. Hash-linked audit records are implemented; independent immutable storage is still required for production.

PRESENTER CUE

Explain who makes each decision. Demonstrated monitoring events are not evidence of real biometric accuracy or attack resistance.

Require a fresh facial check for each export

Examination overview > Export examination > Download report

Show

Select report sections, enter an export reason, and open the facial-verification dialog.

Explain

Report exports require a short-lived, single-use verification token tied to the session and export scope.

Demonstrate safely

Cancel to show that the export remains locked. Camera access requires the person’s browser permission.

Production dependency

Real matching needs trusted enrolment and a server-side face/liveness provider. Demo comparison is simulated.

Be precise about what is proven

Demonstration evidence and production requirements are different milestones

Working and checked

64 automated tests passed in the latest application verification.

Type checks and the production build passed.

Browser checks completed exam, candidate, centre and workstation creation.

Export tests cover missing verification, failed comparison, expiry, scope, session and token reuse.

Still to validate

500 seeded candidates do not prove 500 concurrent examinees.

A representative load test must measure sign-in, paper delivery, answer saves, monitoring and submission.

Record response times, errors, resource use and answer correctness against agreed acceptance criteria.

Before production

Durable database, shared cache and evidence storage; backups and recovery.

Real biometric providers, managed kiosk devices, TLS and production key management.

Security assessment and operational monitoring.

Marking and results release remain outstanding.

CURRENT LIMIT

The current default store is in memory and resets on API restart. Hosting and management costs have not yet been estimated.

A focused 20-minute client demonstration

Use the prepared demo data. Keep the API running throughout the session.

0-2 min	Introduce the workflow	Set the proof-of-concept scope and identify the users.
2-5 min	Open an examination	Show Overview, candidate register and exam-specific navigation.
5-8 min	Prepare the paper	Show question status, review separation, blueprint and integrity.
8-12 min	Deliver an examination	Follow page 11; add 5 minutes for the network test on page 12.
12-15 min	Show staff oversight	Open workstations, live examination and alert review.
15-17 min	Protect an export	Open the facial check; explain the provider dependency and cancel.
17-20 min	Agree the next milestone	Confirm scope, load acceptance criteria and production priorities.

Before the meeting

Check role access and the published exam window. Keep synthetic data in use. Test camera permission beforehand only if a camera demonstration is planned.

Agree what comes next

Turn the demonstration into a clear acceptance and delivery plan

Confirm the operational scope

Which exam formats and question types are required?

Who authors, reviews, approves and invigilates?

What are the centre, workstation, accommodation and reporting requirements?

Define the production milestone

Agree success criteria for 500 concurrent examinees.

Choose identity, device and infrastructure integrations.

Scope marking/results, retention, support and recovery before finalising hosting and management costs.

Suggested closing statement

“The workflow is ready for your review. Once we agree the operational requirements and acceptance criteria, we can plan the production integrations, demonstrate capacity with measured load tests, and prepare a hosting and support estimate.”

Basis: application screens captured on 8 September 2026; project README, completion notes and limitations. Screens contain synthetic data. This document is a demonstration guide, not a security certification or capacity report.

Let the client watch a student take the exam

Presenter instructions | Development accounts only | Allow 5-7 minutes

1. Prepare the demo session

Use the seeded NTAE-2026-01 published exam, not the new CLIENT-DEMO draft.

On a fresh API start it began 45 minutes earlier and lasts 120 minutes: about 75 minutes remain. Check the window before the meeting. Restarting resets all in-memory demo records; do not restart during the presentation.

2. Sign in as the student

Use a separate browser profile or private window to preserve the staff session. Open <http://localhost:5173/exam> on the host computer.

Application ID: NTAE26-000001

Password: Exam!2026

Workstation identifier: WS-CEC-001

Use a fresh, unsubmitted candidate for each full run.

3. Complete entry checks

Show the account, eligibility, workstation and network checks. Complete the required fingerprint/face flow with the normal demo outcomes; explain that comparison is simulated. Allow the camera if prompted. Select Continue to the instructions.

4. Take and submit the paper

Read the instructions, tick the consent boxes, then Prepare my examination and Start the examination. Answer a choice question, wait for saved status, flag a question, and open submission review. Confirm submission and show the locked receipt; no score is generated.

WHAT TO SAY

"Students can take the exam and submit answers in this demo. Production durability, real biometrics and marking/results still need work."

Show an unapproved network being refused

Local demonstration | This blocks exam entry, not access to the website itself

1. Establish the allowed case

Use the fresh student session from page 11, before starting the attempt.

Leave Outside the approved network OFF. Show Approved network verified passing.

The local server maps loopback traffic to 10.42.10.10, which matches the seeded 10.42.0.0/16 range.

2. Demonstrate denial

In the candidate window, open Demo mode. Under Workstation conditions, enable Outside the approved network; close the drawer.

Use Sign out in the candidate screen, then sign in again in the same tab without refreshing. The toggle supplies 203.0.113.55, outside the approved ranges.

3. Explain and recover

Show the failed Approved network verified check and blocked continuation. The activation API also rejects this condition with HTTP 403 / UNAUTHORIZED_NETWORK.

Turn the toggle OFF, sign out and sign in again, and show the allowed case again. Then continue the student examination.

A repeatable demonstration, with a clear boundary

The IP decision and refusal are enforced by the API; the source IP in this local demo is simulated. Login and other pages can still load. The automated attempt-lifecycle test covers denial on activation. This is not a demonstration of a firewall blocking the whole site.

PRESENTER TIP

Keep Network disconnected OFF. Do not refresh while relying on the off-network toggle: its state is held in browser memory.

To block the whole page, protect the web entry point

Deployment demonstration plan | Requires configuration beyond the current application

Set up the intended restriction

Serve the demo from a reachable HTTPS address. At the reverse proxy, firewall or hosting access layer, allow your server-observed public IPv4 address as a /32 and deny other addresses for the demonstrated website and API paths.

Cover IPv6 separately or disable that entry path; prevent access through an unprotected origin. Configure trusted proxy handling so client-supplied headers cannot invent an allowed address.

Demonstrate the two outcomes

On your allowed connection, open the site and show that it loads.

From a separate connection, such as a mobile hotspot with a different public IP, open the exact same URL. Show the access-layer denial (for example, HTTP 403). Return to the allowed connection and verify it still works.

Keep an administrative recovery route for changing the rule.

Two details that can otherwise spoil the demonstration

A second device on the same Wi-Fi may share your public IP and remain allowed. Also, localhost on another device refers to that device, not your computer; a failed localhost connection does not prove IP filtering.

For exam-entry-only restriction, use the exam or seat-assignment IPv4 CIDR policy. Assignment ranges take precedence; backup ranges also allow access. Changing a centre record alone does not rewrite an existing exam policy.

STATUS

This PDF describes the whole-site IP test as a deployment step. No firewall, proxy or public-IP restriction was applied by this document update.
